1. I assign the works by row dispatch
2. chart

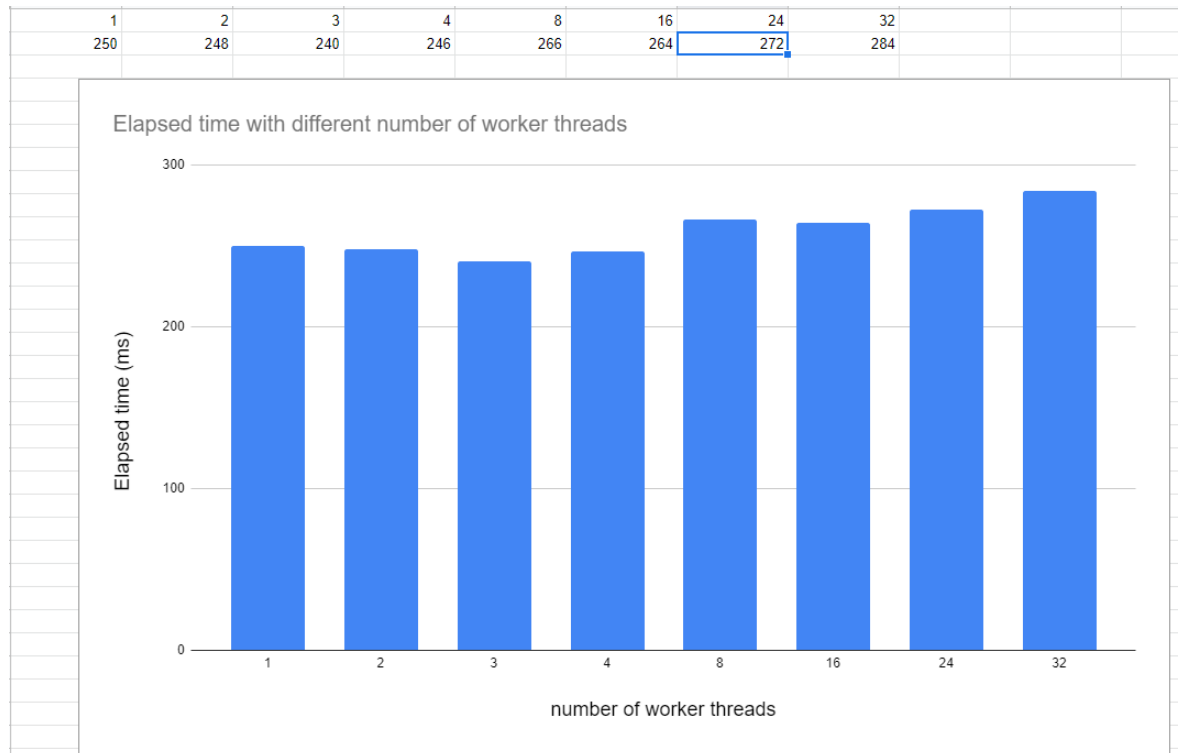

### a. tese\_case1

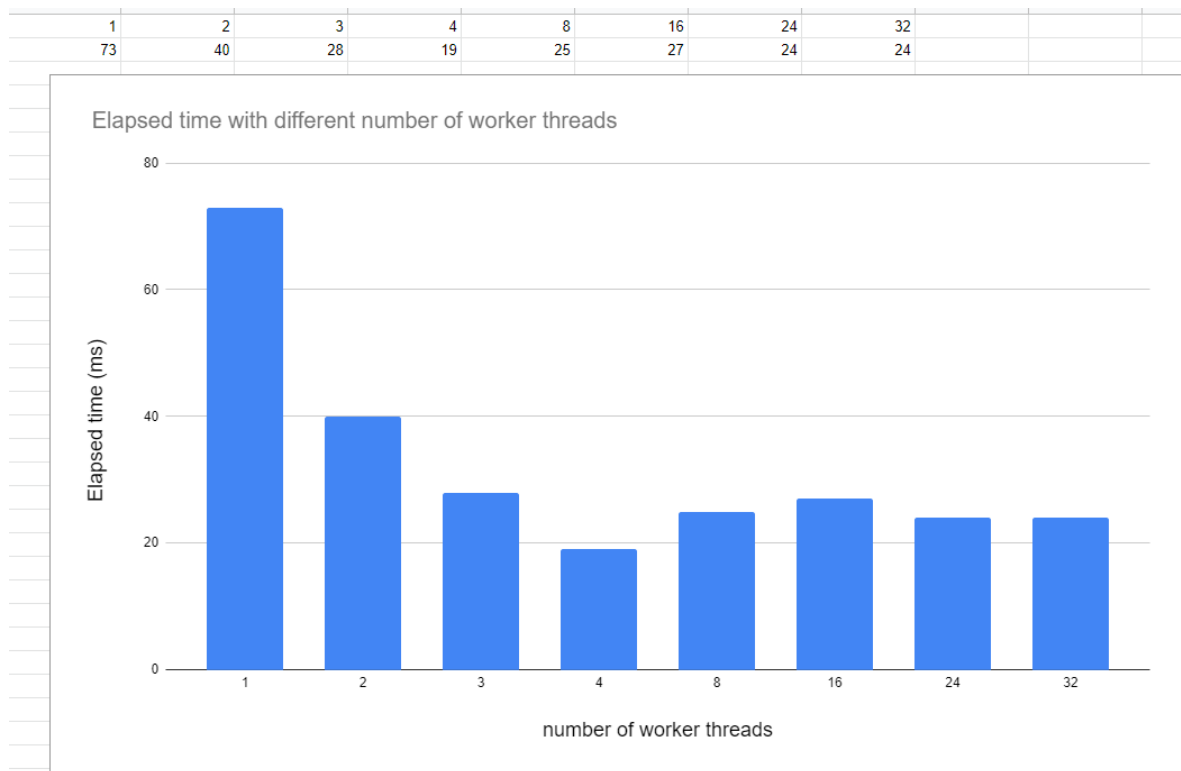

### b. tese\_case2

### c. tese\_case3

d. tese\_case4

3. summarize the four charts

- for test\_case1.2.4**, if threads number is less than cores, the execution time is plunge fast, however, if threads number is more than cores, the execution time is same roughly.
- for test\_case3**, because I use row dispatch, so all operation are all in thread 1, so when I create more thread cost more time instead.
